Abstract (en)

[origin: EP0934895A2] The material panel is provided with an adhesive surface. It is removed from the support roller (5) and cut through in a separating area prior to separation. A loop (19) of material is formed in the separating area Independent claim describes winding device with two support rollers, a separating device, an adhesive applicator and holding device. The holding device has at least one roller segment (16) which can be switched over between two states. It exerts a contact pressure onto the material web which is variable.
