Abstract (en)

[origin: EP0936205A1] Non-explosive pyrotechnic material, which is auto-combustible at or near atmospheric pressure, comprises an energizing binder and ammonium perchlorate. The material is auto-combustible after initiation by an electrical pulse. Non-explosive pyrotechnic material, which is auto-combustible at or near atmospheric pressure, comprises an energizing binder and ammonium perchlorate. The material has a thickness less than 500 microns or a mass less than 15 mg. The material is auto-combustible after initiation by an electrical pulse, P, such that $150 \text{ mW} \leq P \leq 800 \text{ mW}$ for a time, t, such that $20 \text{ ms} \leq t \leq 600 \text{ ms}$. the material comprises: 25-80 wt.% energetic binder based on glycidyl polyazote (PAG), or poly-3,3-bis(azidomethyl)oxetane (BAMO), or polyester or polyether and at least one energizing plastifier; 10-70 wt.% ammonium perchlorate with grain size of 0.5-30 microns; and 0-45 wt.% at least one nitroamine. Independent claims are also included for energizing compound for making the material; and use of the material as micro-generator for gas or heat.
