Abstract (en)
[origin: WO9809691A1] A suspension mechanism for in-line skates. The in-line skate includes a boot (14) and a tracking system (18) attached to the sole of the boot. The suspension mechanism includes an attachment mechanism (35) that connects to the tracking system at one end and the wheels (20) at another end. The suspension mechanism further includes a biasing member (39, 59, 98, 108) so that the wheels move individually relative to the boot when it encounters uneven surfaces.
