Abstract (en)

[origin: EP0939225A2] The arrangement has a hyperbolic regulator which acts via a pivoting lever on a control pressure valve (10) and an engagement element (17) which can slide on the lever so that the lever arm, with which the engagement element engages the lever, can be varied, whereby the engagement element is subjected to the working pressures in the working lines (6, 7). Separate displacement devices (4, 5) are provided for each pump (2, 3). The regulator (1) is a separate valve unit. The control pressure valve (10) regulates a control pressure that is fed to the displacement device and to both pumps to adjust the delivery volume. The lever arm is fixed by a first control element (21) connected to the control pressure line. The control pressure valve is also acted upon by electromagnets.
