Abstract (en)
[origin: WO9823380A1] A solids dryer (10) is positioned downstream from a centrifuge with inside-out filter (1), whereby the solid is dehumidified and dried in the centrifuge with inside-out filter by spinning, compressed gas compression and/or heat convection, and in the dryer by heat contact and/or heat convection. The centrifuge with inside-out filter and solids dryer are connected by a locking device (18) to form a single unit. Sensors (35, 63-69) measure the prevailing levels of dehumidification and dryness and determine other operating parameters. The sensors activate a common control unit (71) which regulates the operating parameters. The control unit independently regulates the operating parameters in such a way that the operating times for dehumidification and drying in the centrifuge with inside-out filter and the solids dryer are harmonized and that at the same time the mechanical spinning energy and thermal energies expended by the centrifuge with inside-out filter and the solids dryer are optimally distributed.
