Abstract (en)
[origin: WO9916094A1] A switch has a contact lever (1) and a pressure element (2) provided with an articulated axis (4). A bearing (5) that supports the articulated axis and is arranged in an articulation-receiving cavity (6) of the contact lever (1) establishes an articulated connection between the pressure element (2) and the contact lever (1), preloading the contact lever (1) in the contact position. The switch is characterised that the articulation-receiving cavity (6) has two open sections (6a, 6b) located one after the other in the loading direction of the pressure element (2), so that the bearing (5) can be inserted into the first open section (6a) in a direction different from the loading direction, then moved in the loading direction in order to positively fit into the second open section (6b).
