Abstract (en)

The present invention relates to a device for adjusting the position of a quarter (4) with respect to the shell (2) of a boot, particularly for ski boots. The device is constituted by at least one lever (6) which is pivoted transversely and to the rear with respect to the shell (2). The lever (6) has a first end (11) which interacts with a jaw of a binding rigidly coupled to a ski; the first end acts in contrast with at least one first flexible member (15). The lever has a second end (20) which selectively interacts with the quarter (4). <IMAGE>
