Abstract (en)

[origin: EP0941931A2] The device contains several troughs axially spaced from one another and located between right and left frame parts (2,3). The products to be collected roll or are pushed into the troughs over a sloping surface. A belt strap (6) in the head area of the frame parts is crossways tensioned at the level of the uppermost layer. The strap works in conjunction with deflectors in the head area of the frame parts and supports the products coming into the trough and lowers to the trough base correspondingly to the inflow of products. Both ends of the strap are connected with springs (7,8,12) in the frame parts.
