Abstract (en)

[origin: EP0943353A2] The adjustment component is formed as a proportional valve controlled electrically and with at least one piezo component (6) for carrying out a positioning movement. The piezo component is formed from a stack of piezo discs (9). These discs have such a material consistency that when an electrical voltage is applied a tipping is caused. The piezo component (6) is coupled to a lever (5). The adjustment device is formed as a rotary link with a rotary axis in the surface centre of gravity. The stacked piezo discs are fed with a mechanical stack tension.
