Abstract (en)
[origin: EP0943537A2] The lift rope (8) runs from the fixture end (5) of the beam (3) to a fix deflector (10) provided on the beam and is then deflected downwards. At least one deflector is arranged movably relatively to the beam and works in conjunction with the lift rope. At the free end (4) of the beam is a rotary link (11) via which a downwardly hanging pivot arm (12) is rotatively movably connected. The movable deflector is arranged on the pivot arm and in common with it is pivotably upwards to the beam. The lift rope fed downwards from the fix deflector is guided over the movable deflector and hangs away from it vertically. The load hook (9) has a stop working in conjunction with the movable deflector, which prevents the load hook slipping away over the deflector.
