Abstract (en)
[origin: EP0943564A2] The suspension devices (61,62) are formed to suspend the complete transport container centrally to the material plates (76,77). The suspension devices are provided with first coupling parts for selective releasable coupling to corresponding coupling parts (93,94), which are fittable to a first suspension device (90) suspendable from a crane. The first suspension device is formed for coupling the complete transport container centrally to the material plates. The hood (10) has a basic frame with two parallel longitudinal beams (22,23), at right-angles to which and fixed to one end of them is a cross beam. A connecting beam is fixed selectively in a connecting position parallel to the cross beams at the two other ends of the longitudinal beams. It is removable from the connecting position to make possible the fitting of the hood in a horizontal longitudinal position over the frame (70).
