Abstract (en)

[origin: EP0943589A1] The invention relates to a staff plate at least one edge of which is chamfered in such a way that the chamfered edge presents a segment extending perpendicular to the plate surface. The height of said segment is between 5 and 50 % of the plate thickness but equal to at least 1 mm and the chamfer width is at least 3 mm. A dry joint-filler mixture appropriate for this type of staff plate contains, in each case in relation to the weight of the mixture, between 70 and 98 weight % plaster of Paris with a particle size of < 300 μm, between 0.02 and 0.5 weight % thickener, between 0.2 and 1 weight % water-retaining agent, between 0.5 and 3 weight % polyvinyl alcohol and between 0.001 and 0.1 weight % of boric acid or an alkaline-earth or alkaline salt of boric acid, as well as standard additives.
