Abstract (en)
[origin: EP0945564A1] The structure has a plate, a transition support piece (12) and a counter support piece (14). The support pieces have suspension devices, by which the transition support piece can be suspended, preferably at an angle to the vertical and pivotally. Locking devices are provided to lock the transition support piece to the counter support piece in the work position. The locking devices consist of at least one, preferably two, adjacent locking levers linked to one of the support pieces, and support a bolt, which with the support pieces suspended and with the locking lever in the locked position engages on the other support piece. The support pieces are firmly connected with one another, particularly clamped.
