Abstract (en)
[origin: WO9828136A2] In a method for determining the density of an inking cylinder which is formed in the ink fountain of a rotary press, the density of one or several locations is detected directly or indirectly. The measuring values thus obtained are converted into electric signals which can be evaluated. A signal is generated to the ink feed or a warning signal is transmitted according to the extent and direction of deviation. The invention also relates to other devices involved in said method.
