Abstract (en)
[origin: EP0947797A2] The battle simulation method uses the armored vehicle itself as the simulation space. A battle simulation processor (14) is coupled to the onboard central processing system (1), for providing a simulated battle scene on the viewing monitors (3-5). The simulation processor provides simulated function data, corresponding to the operation of the vehicle controls, with all real functions of the vehicle, e.g. the engine, the steering and the weapon systems being blocked. An Independent claim for a battle simulation device is also included.
