Abstract (en)
[origin: EP0948244A2] A self ballasted fluorescent lamp includes a rectifier (4a) which full wave rectifies AC power (1) from a commercial source. A smoothing capacitor (C2) smoothes the rectified power. The smoothed, rectified power is provided to a high frequency generating circuit (HFG) which drives the fluorescent lamp (DL). The capacitance value C of the smoothing capacitor (C2) is selected such that $W \geq \alpha C$, where W (in watts) is the rated service power of the fluorescent lamp (DL), and alpha is related to a ratio of W to C0 (in μF). C0 is a capacitance value of the smoothing capacitor (C2) for which the 5th harmonic component of the input current is 61% of the fundamental component of the input current when the fluorescent lamp operates under fixed conditions. When the above condition is met, the percentage of harmonic content falls within IEC standards. <IMAGE>
