Abstract (en)

[origin: DE19746987A1] Roller bodies (8, 9, 10) are provided between three surface pairs (5, 6, 7) that can be twisted in relation to each other in a four-ringed eccentric bearing to enable precise adjustment of printing machine cylinders in favourable oscillation and rotation conditions. A double-row cylindrical roller bearing (8, 9) or needle bearing is arranged on the side of the movable bearing outside two double-row tapered roller bearings (10) as an innermost bearing. Three double-row tapered roller bearings (15, 16, 17) are provided on the side of the fixed bearing.
