Abstract (en)

[origin: DE19744873A1] An isolated DNA fragment or recombinant DNA construct (I) that contains a sequence encoding all or at least part of a sterol glycosyltransferase (SGT), is new. Also new are: (1) proteins (A) encoded by specified (I); (2) plasmids, viruses and other vectors containing (I); (3) genomic clones containing (part of) a gene corresponding to (I); (4) a chimeric gene (CG) that, in transformed cells, can change the content of SGT; (5) transfected cells, microorganisms, plants or plant parts containing CG; (6) steryl glycosides (SG) or secondary metabolites produced by the cells etc. of (5), (7) analogues (Ia) of (I); (8) a chimeric gene (CG') containing (Ia); (9) transfected cells containing CG'; (10) organisms, particularly bacteria and yeast, in which a gene for SGT is deleted or interrupted by transfection with CG'; (11) SGT, or their fragments or fusion proteins, produced by any of (5), (9) and (10); and (12) antisera and antibodies or their fragments raised against the proteins of (11).
