Abstract (en)

[origin: WO9819026A1] In a method for supporting wood pieces (1) with at least one fixing means (4), the wood piece (1) is formed as a structure comprising at least two walls (1a, 1b, 1d) and a bottom part (1c) in its cross-sectional profile form, wherein the outermost walls (1a, 1b) and the bottom part (1c) of the wood piece (1) limit an inner volume (2). The wood piece (1) is supported on at least one wall (1a, 1b, 1c) on the range of three quarters of the height of the inner volume (2) located closest to the bottom part (1c) in the cross-sectional profile form, advantageously in the range between the midpoint of the height of the inner volume (2) and the bottom part (1c), preferably in the range of that quarter of the height of the inner volume (2) which is placed closest to the bottom part (1c) of the wood piece (1) in the cross-sectional profile form.
