Abstract (en)
[origin: WO9923758A1] A processor (30) and integrated filter and detection process (20) having reduced signal processing requirements. The integrated filter and detection process and processor has a first pass filter (12a) that filters input data comprising a plurality of data entries. First pass threshold processing (13a) is performed on the filtered input data by thresholding each of the plurality of data entries using a predetermined threshold to generate a thresholded first pass data list (14a). A second pass filter (15) having a predetermined number of filter stages is then used to filter the thresholded data entries. Final thresholding process (16) is performed on the filtered data entries generated by the filter stages of the second pass filter. The final thresholding process generates a thresholded data list (17) that is output by the process or processor.
