Abstract (en)

[origin: EP0950792A1] The safety device comprises a flange (11) integral with the winding shaft (3) of the shutter (1). A stop (12) is positioned on one of the lateral sides of the shutter. The radial and angular positions of the stop relative to the cheek web can be adjusted. The cheek web and latch stops have their combined front surfaces so as to allow their self locking at the end of unwinding in a position where they are buttressed against each other.
