Abstract (en)

[origin: DE19750049A1] A sensor arrangement comprises a sensor (23) and an evaluation circuit for evaluating the output signal from the sensor (23). The evaluation circuit has at least one first current source (21) connected to an operating voltage (UB) by means of which current is led through the sensor (23). A second current source (22) is connected in series to the first current source (21). Both current sources (21, 22) are designed as constant-current sources with a control input for adjusting the constant current. A negative-feedback network (24) is provided for adjusting the constant current in such a way that the output voltages (U1, U2) of the current sources (21, 22) take predetermined values. The thus adjusted constant current is used for the unearthed measurement of the sensor inner resistance (8).
