Abstract (en)

[origin: EP0951997A1] During an activated washing process of the pipette and inking rollers the locking of the contact of the pipette roller (2) with the ink box roller (1) is released through a control (11). At the same time the largest possible contact time between the pipette roller and friction roller (3) is produced. At the end of the washing process the drive of the pipette roller is reset by the control corresponding to the values provided for the printing operation. The drive (5) of the pipette roller has a pipette block which is released by the control unit during washing and prevents contact of the pipette roller and ink box roller.
