Abstract (en)

[origin: EP0952499A1] The device uses a sliding plate (106) on the external surface (108), which arms a repetitive ringing mechanism and is connected through a cover to a slide which controls the required function. The plate has a sealed joint (136) which is arranged to apply itself against the opening between the plate and the external surface and a control system (104) which includes a hinged lever (144) which allows the passage from the 'arming' state to the 'rest' state and vice versa.
