Abstract (en)
[origin: EP0952598A2] The arrangement has a contact mat (4) with keys (11) that are associated with defined functions. At least one key is metallised. The metallisation is produced by providing the metallised key with an electrically conducting coating in a first step and applying the metallisation in a second step. There are different regions (5-8) with keys with different metallisations produced by providing the keys with the same metallisation with a common electrically conducting coating. An Independent claim is also included for a method of producing a control arrangement.
