Abstract (en)
The system uses addition of components of successive orders to determine dephasing required for operation. The aerial comprises an array of dephasers (2, Dij), with N simultaneous beams being obtained in N directions by an excitation law (fij) applied to each dephaser (Dij). The excitation law is calculated by summing the phase laws ($\phi_1, \phi_2 \dots \phi_N$) associated with each direction of order 1, 2, ..., N, and by applying the resulting phase shift (SIMILAR fij) to the dephaser, without applying the resultant amplitude modulation (SIMILAR pij). The frequencies of the beams used are different. The phase laws (SIMILAR f1, SIMILAR f2 ... SIMILAR fN) may each be affected by a weighting coefficient (r1, r2 ... rN). The weighting coefficients are determined to obtain a sum channel and a difference channel in two different directions.

Abstract (fr)
L'invention concerne une antenne à balayage électronique à multifaisceaux. L'antenne comportant un réseau de déphaseurs (2, Dij) , les N faisceaux simultanés sont obtenus dans N directions par une loi d'excitation (fij) appliquée à chaque déphaseur (Dij) qui est calculée en sommant les lois de phases $\psi_1, \psi_2, \dots, \psi_N$ associées respectivement à chaque direction d'ordre 1, 2, ..., k, ..., N et en appliquant le déphasage résultant (ψ_{ij}) sur le déphaseur, sans appliquer la modulation d'amplitude résultante (pij). Application : notamment antennes à commande de phase uniquement dans le cadre de communications par satellites ou terrestres nécessitant une communication simultanée avec plusieurs sites variables.
