Abstract (en)
[origin: EP0917177A1] Apparatus has source (2) for producing primary corpuscles e.g. electrons, in a primary beam (PE). Particle lens (24) deflects corpuscles from the source to sample (26), and detector (14) senses secondary corpuscles from sample. Magnetic and electrostatic excursion deflectors (52,54) cause primary beam to be directed obliquely to optical axis (A), and deflector (56) below the detector guides the primary beam to optical axis.
