Abstract (en)
[origin: EP0953686A1] The plow has a plowing section (2) and at least one locking member (18) located at one end of the section. The locking member enables the plowing section to be either in an operational position in which the member closes the corresponding opening of the plow, and a rest position where the locking member frees the opening. The member has a flexible construction and extends between two clam arms (16,17) which are moveable relative to one another in such a way that the locking member is stretched in the operational position and folded together in the rest position.
