Abstract (en)
[origin: US6286734B1] A clothes hanger with a pants holding device comprising a shoulder contour segment with a hook, a cross bar between the arms of the shoulder contour segment and a flexible spring element which is attached to the pants holding device. The spring element extends somewhat parallel to the cross bar and is held in place by means of interlocking openings. The spring element can be moved between a release position and a clamping position, wherein the pants are firmly clamped between the cross bar and the spring element in the clamping position. In order to design the pants holding device with an economy of means and long-lasting efficiency, to securely retain the spring element in the clamping position and in the release position and to enable troublefree switching of the spring element from one position to the other, the ends of the spring element are held in the interlocking openings by forming a joint having a substantially stationary rotating axis.
