Abstract (en)
[origin: WO9715507A1] A closure device for a container (4) comprising a cap (1) having a piercing member (2) and a locking sheath (3). When the cap (1) is rotated in the direction to open the container (4), the cap (1) moves first downward and then upward relative to a container (4) to which it is affixed. During the downward movement of the cap (1), the piercing member (2) causes rupture of a seal (6) on the container (4) and a means for attaching the locking sheath (3) to the inside of cap (1) affixes the sheath (3) to the cap (1) such that when the rotation of the cap (1) continues the resulting upward motion causes the removal of the cap (1) and locking sheath (3).
