Abstract (en)

[origin: WO9737293A1] A modular field computer workstation includes a technology module (146) removably attached to a housing (42) having multiple openings (72) of module bays for receiving and connecting an array of peripheral devices or modules to the technology module. The computer is designed to function in adverse environmental conditions and to survive high intensity shock and vibration, even while operating. The housing includes a chassis having two integral side flanges (56), two end panels (60, 64), an integral handle (62), and a removable monitor support (54); expansion module docking plates (74); and a removable base plate (50). The surfaces defining the outer periphery of the housing and the display monitor, as well as certain internal sub-systems, are coated with an impact absorbing material (70). The expansion module docking plates include receiving locking, and ejection mechanisms.
