Abstract (en)

[origin: EP0955160A2] The core roll (1) is coated with release agent and the non-elastic tube (20) is drawn over the core leaving a gap between them. After centering the tube on the roll an elastic compressible material (60,65) is injected between them and cured. Preferred Features: The gap is vented during injection through sealable vents (50) which are closed immediately the gap is filled and further material is then injected to compress the material in the gap. The vents and/or injectors (40) are located in the tube centering device (30).
