Abstract (en)

[origin: DE19653046A1] The invention relates to a device for attaching a slideable window pane of a motor vehicle to the control device of a window winder. Said device comprises a first part with a raised, protruding stop element and a second part with a substantially horizontal, oblong recess with which the stop element forms a positive fit, whereby one of the two parts is connected with the window pane and the other part with the window winder. The device is characterized in that the recess (12, 12a, 12aa, 12c) of the second part (1, 1a, 1c) has an inlet opening (10, 10a, 10c) running in the direction of the stop element (2, 20a, 20b, 20c); the vertical centre axis (100) of the inlet opening (10) and the vertical centre axis (200) of the stop element (2) are at a distance from each other; the horizontal extension of the recess (12, 12a, 12aa, 12c) is at least 1.5 times as wide as the stop element (2, 20a, 20b, 20c); and the stop element (2, 20a, 20b, 20c) is prevented from leaving the attachment area. The invention is characterized in that it permits simple and safe assembly and adjustment of the window pane while at the same time increasing the functional reliability of the window pane. If necessary, blind assembly is also possible.
