Abstract (en)

[origin: EP0957328A2] The preheater for an advancing strip of material made from smooth and/or corrugated layers is designed to heat the strip before applying adhesive and attaching another layer. It uses a heating element (14) which has a series of preheating sections (50, 50', 50, 50') which lie adjacent to one another across the strip of material, each being filled individually by a heat-carrying fluid, preferably steam. The heating element has a thrust face with convex curvature, preferably in an arc with radius 500 mm, and has supporting and covering plates (18, 20), the latter enclosing the cavities filled with the heat carrying fluid.
