Abstract (en)
[origin: EP0957506A1] The X-ray radiator has an electron source (3) for emitting electrons. It also has a target which emits X-ray beams when struck by electrons. The target is made of a liquid metal e.g. mercury which circulates e.g. by means of a pump, in the operating state of the emitter. A window (2) is disposed between the electron source and the target. Electrons pass through the window and the window is cooled by the circulating liquid metal.
