Abstract (en)

[origin: WO9849019A1] The device is used to clean paint rollers after use, with the aid of water. It has a paint scraping segment (2) fixed to a handle (1). The segment (2) takes the form of part of a ring, and its inner surface (10) is arc-shaped. The radius of the arc is adapted to the diameter of a roller. In addition, the surface (10) is chamfered (13) on both sides. The segment (2) is fixed to the handle (1) in a fixed or removable manner, for example by means of a screw. On the outer side of the segment (2) there are further arc-shaped recesses (11 and 12); the radii of these are adapted to the dimensions of painting devices having small oval cross sections. A cleaning brush (3), which is used to clean those elements of painters' equipment that are difficult to reach, is fixed to the handle (1) on the opposite side to that which carries the segment (2).
