Abstract (en)
[origin: WO9832111A1] The subject invention concerns a device for phonological training, comprising sound reception means (1), operating means (5) for controlling the device, interpreting and processing means (2), and presentation means (3), said presentation means (3) comprising a display screen divided into a plurality of windows (11-17) for simultaneous presentation of a graphic reproduction of the desired sound as well as of the sound produced by the user and received by the sound reception means (1), and of an animated reproduction of speech organs. Characterising features of the invention are that the device is adapted to reproduce the sound by means of field(s) (41, 42, 51, 52), the longitudinal extension of said field(s) in one direction reflecting the time during which the sound is produced and the fill-up, such as colours, shading or the like, of said fields denoting the place of formation of the sound in the oral cavity.
