Abstract (en)
[origin: EP0958867A2] The flap guide (20) can selectively be moved into at least two positions. In a first position, the guide locates on at least one of the clamp rollers (10,12) so that it impedes it. The band (14) is thus forced to deviate from a normal path in order at an angle to follow a path to the winding pin (16) and a second position in which the guide does not locate on the clamp roller. This process prevents unnecessary wear or groove formation on the surface of the clamp rollers during winding after the band has been brought into engagement with the winding pin and wound around it.
