Abstract (en)

The invention describes a method for obtaining a reflective or polished-like surface (similar to that of polished stone) using a plastic lining (8, 20) as the surface of the mould (22). The plastic lining (8, 20) must be left attached to the surface of the cementitious mixture for a predetermined curing time. The cementitious mixture will then achieve the required surface quality. The use of e.g. polyethylene sheeting in a structural mould has the advantage that it can be left on the object for the desired curing time after the structural mould (22) has been removed for further immediate casting. This is convenient because the plastic has a low cost and is recyclable. <IMAGE>
