Abstract (en)
[origin: DE19822563C1] With the rotary closure closed, the sealing component (30) is firmly clamped in a sealing manner between the screw cap and the container mouth. An additional elastic component (20) is provided, of which with the rotary closure closed sections (21) are clamped between the clamped part of the sealing component and the screw cap (10). Through the one or more apertures (15) of the screw cap grip area, sections of the additional elastic component extend into the grip area of the user. The clamp area sections of the additional elastic component have radially outwardly directed tongues. The screw cap has an accurately positioned central aperture (15) in its head plate (14).
