Abstract (en)
[origin: EP0959188A2] For accommodation of the tractive and/or pressure reinforcement components in the structural body crossways to a vertical longitudinal plane run through passage apertures, in which a tubular body can be inserted, which on its outer surface has several peripherally running ribs via which the tubular body is supportable on the inner wall of the through passage aperture in the structural body. The tubular body (3), at least sectionally, in relation its length widens conically to at least one end and the output limits of the ribs (17), at least in the inserted area of the structural body, form a common enveloping cylinder or prism or cone.
