Abstract (en)

[origin: WO9829367A1] The present invention provides a method and apparatus for separating olefins from an olefins-rich product stream comprising producing a product stream comprising at least about 60 % olefins passing said product stream through an olefin selective facilitated transfer membrane, and immediately thereafter collecting a permeate stream comprising about 0.2 wt.% saturates or less. A key advantage of the invention is that a demethanizer or a deethanizer is not required to recover the second olefins-rich product stream.
