Abstract (en)

The invention relates to a method of replacing frames (5) in facade openings above ground floor level, such as frames (5) around windows, and to a suspended scaffold for use in such a replacement. According to the invention, a suspended scaffold is initially erected through the window, permitting one or more persons to work at the external side of the window, following which the old frame (5) is removed, optionally piecewise. The new frame (13) is arranged on the scaffold at the external side of the facade during the erection of it, so that the parts of the scaffold passing through the window opening also pass through the new frame, and the new frame (13) is inserted from the external side after the removal of the old one (5), following which the necessary finishing treatment is carried out from the scaffold. <IMAGE>
