Abstract (en)

[origin: WO9931611A1] A received electronic mail is stored in a reception record memory. A classification item setting section sets a classification item for an electronic mail and a number of receptions setting section sets the number of receptions. A determining section reads information (a kind of classification information, for example "Yamamoto") of the classification item (for example "a transmitter") from a newly received mail, and there is created a folder storing an electronic mail of "Yamamoto" and displayed an electronic mail list stored in the folder by activating a folder creating/display section if a given number (the set number of receptions) of an electronic mail having the kind of classification information of "Yamamoto" is received.
