Abstract (en)

A device is described, for the liquid supply and dosage in the tub (7) of a domestic washing-machine tub, in particular a dishwasher, wherein the liquid dosage is realized by detecting the level of the liquid being present within the tub (7), said device (6) comprising detection means (16A,16B,17A,17B,18A,18B,19A,19B) located outside the tub (7) and operating on the basis of the amount of liquid supplied in the tub, a conduit (C2,13,T) being provided to put said detection means (16A,16B,17A,17B,18A,18B,19A,19B) in communication with said tub (7). According to the invention, closure means (V) are provided, for shutting said duct (C2,13,T) at the end of a liquid supply operation in the tub (7), so as to prevent the substantial liquid return from said tub (7) towards said detection means (16A,16B,17A,17B,18A,18B,19A, 19B). <IMAGE>
