Abstract (en)

[origin: EP0962401A1] A loading device for a refuse-collection device comprises a pick-up device for picking up refuse containers which are provided with a pick-up part (4) which is open downwards. The pick-up device is provided with a pick-up member (5) which can engage beneath this pick-up part (4), and a locking member (7) which is arranged in the vicinity of the pick-up member (5) and can move between a locking position and a non-locking position. In the locking position, the locking member (7) is situated at a distance above the pick-up member (5), and in the non-locking position the locking member (7) is situated next to the pick-up member (5). The loading device furthermore comprises control means for automatically controlling the said device. The locking member (7) is coupled to the control means, which are designed such that, in the event of certain predefined unsafe states of the loading device occurring, the locking member (7) is moved into the locking position by the control means, so that it is impossible for a refuse container to be placed on the pick-up member (5). <IMAGE>
