Abstract (en)

[origin: EP0963852A1] A device for direct electrostatic printing with an addressability AD in dots per cm having a means for delivering charged toner particles coupled to a means for applying a first electric potential (DC1) and a means (DC4) for applying an electric field between the means for delivering toner particles and an image receiving substrate (108). The electric potential difference |DC4-DC1| creates a flow of the charged toner particles (104) towards the substrate. In the flow of toner particles a printhead structure is placed having printing apertures, control electrodes associated therewith and deflection electrodes. Between the printhead structure and the image receiving substrate, a gap, dB, is left so that $((|DC4-DC1|)/dB) = R1 \leq 1.5 \text{ V/ } \mu\text{m}$. The deflection electrodes are coupled to a voltage source for applying a varying voltage to the deflection electrodes. Preferably that varying voltage has a peak to peak value, Vp, so that $Vp/R1 > 250 \mu\text{m}$.
