Abstract (en)

[origin: FR2760547A1] The invention concerns a computer equipment comprising a plurality of interconnected elements such as a central processing unit, one or several mass storage units, one or several read-write memory units, one or several units communicating with external networks such as a modem, a router or network adapter, as well as peripherals. The invention is characterised in that each of the computer elements is provided with a circuit interfaced with a nano-network capable of being connected to a local and/or external network to form an extended network. The invention also concerns a method for optimising the computer resources of a plurality of users each provided with such a computer equipment.
