Abstract (en)

[origin: WO9839759A1] An image graphic mating web is provided having an imageable major surface and an opposing major surface having a nonadhesive substrate mating surface. Substrate mating surfaces include surfaces that employ at least one element of mechanical fasteners such as hook and loop fasteners. The imageable surface is prepared using surface modification techniques such as corona treatment, liquid coatings dissolved or suspended in either organic solvents or water, or a 100 % solids polymeric material that can be extruded or coextruded onto the surface. The image can be formed by any conventional method, such as using solvent based inks, 100 % solids ultraviolet curable inks, inkjet printing, thermal transfer imaging and electrostatic transfer imaging.
