Abstract (en)  
[origin: EP0965395A2] The arrangement has a sleeve-shaped carrier (5) rotatable about an axis (2) with a characteristic maximum speed and an application tube (1) rotating about the carrier with a wire outlet connected to the carrier via a holding arrangement. A compensation plate (6) used to compensate for the imbalance caused by the application tube and holding arrangement is mounted opposite the application tube relative to the rotation axis in each axial position and can rotate about the carrier. The plate thickness and height are selected to locally compensate for the imbalance caused by the application tube and mounting plate in each plane perpendicular to the rotation axis.
